

Q: How do I get started on my new ETS system?

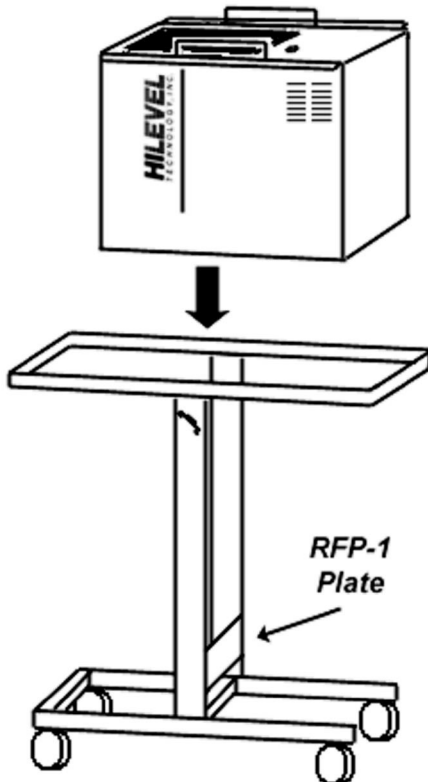

Getting Started On Your ETS

Installation of your ETS tester is surprisingly easy. It consists of three basic steps:

1. Assemble the computer as you would any standard PC.

2. Mount the ETS system in the cart. Always position the tester with two feet of air space around all sides.

3. Connect the USB cable and power cable, and plug in the TestBox.

You can download the QuickInstall guide at the Q'nApps Application Notes page on our website. Also obtain a copy of HiLevel's QuickStart guide if you don't already have one. It will help you with your initial power-up, diagnostics, and calibration, as well as developing your first test.

By spending time with your ETS *before* your training, you'll be prepared to ask valuable questions during a training class. Our focus in training can then be to make you an advanced user rather than just a "better beginner". You can also download a PowerPoint Basic Training Guide from our server at hilevel.com. If you have further questions about getting started or would like to purchase a training class, email us or call 1-800-HILEVEL.
